### Aquarium Rocks that Provide Shelter for Small Pet Fish and Aquarium Live Rock for Natural Maintenance

Most aquarists and fish enthusiasts agree that there are many benefits to using live fish products, such as aquarium live rock and sand, within their reef and salt water fish tanks. As it contributes to the overall water quality, aquarium live rock also enhances the beauty of your aquarium. In addition to other types of aquatic décor, there are various aquarium rocks, plants and substrates that help to create a natural looking environment for your fish. Whether you have exotic salt water angelfish or small pet fish, such as goldfish, it's important that you provide them with a stress-free environment that is big enough for them to swim and explore. Striking and beautiful, fish of all types are enjoyable to watch as they gracefully swim over various aquarium rocks and through decorative fixtures, as well as from one end of the tank to the other. Ideal for a living area of practically any size, aquariums can be easily maintained and range in size to appropriately house large and small pet fish.

Proper tank maintenance can be as simple as routinely changing out the water and cleaning the substrate from a freshwater tank housing your small pet fish, or as complex as using products, such as ammonium chloride to cycle your salt water fish tank. Composed primarily of the calcium carbonate of coral skeletons on which beneficial bacteria thrives, aquarium live rock acts as a natural biological filter for your reef aquarium. It also serves as a platform for various corals and invertebrates. Aquarium rocks, live or decorative, are important aquarium items as they provide your fish with shelter, which may be much needed by small pet fish, if sharing a tank with larger pet fish.

In addition to various types of substrate, aquarium rocks, plants and other types of decorations can enhance the beauty of your aquarium, while live plants help oxygenate the water. As aquarium live rock contributes to water quality, various other organisms, such as sand sifting starfish, cleaner shrimp, arrow and hermit crabs as well as algae-eating snails naturally help maintain your tank. Preserve the beauty and water quality of your aquarium as well as the health of your large and small pet fish with the various rocks, organisms and other products designed for proper tank care and maintenance.
