

Mi-Laser Projector : A Movie Theater In Your Living Room

By: Sue Giplaye

Have you ever wanted the experience of a movie theater, without having to wait in line for a ticket? Well China, being well known for always being ahead in the technology industry, has created a Laser Projector, which will make you feel like there is a movie theater right in your living room.

What A Mi-Laser Projector Is

[Mi-Laser Projector](#) is a 150 inch display with laser technology. The same technology that is used at a theater, is used on this advanced projector. With the setup, comes a built-in speaker system.

L.A.S.E.R. It is an acronym that stands for Light, Amplification, Stimulation, Emission, and Radiation.

Lasers are often associated with nuclear weapon equipment, but that is not always the case. They are also very useful as a source of light from a video projector. Before the laser, there was the lamp. But lamps can take up a lot of power and burn a lot of heat. [Lamps](#) also do not last long. They usually burn out after 3,000 to 5,000 hours. LEDs are better than lamps. But they are not very efficient. LED lights are chip-based. So as it emits from the chip, the distribution of light is poor. The [Mi-Laser Projector](#) provides light better than a Lamp or a LED would. Less power is used, because the laser only has to create one color.

It can go instantaneously on and off the same way a normal T.V would.

The Lens design is impeccable. The size can be adjusted to your liking. It can be connected to Wi-Fi and Ethernet.

The Mi-Laser Projector uses a laser light that is evolved by [Appotronics](#). This is a technological company in China that creates 90 percent of the laser in their country's movie theaters. China can always be trusted when it comes to technology. When the United States is still just presenting the iPhone 3, they are already working and playing on the iPhone 4. This projector can last on a shelf for 25,000 hours. So let's say you use this [projector](#) only 2 hours a day. It will last you for 34 years. Usage of it for 4 hours a day will get you a good 17 years of it. If you own this projector you will enjoy a nice entertaining experience.

If you are worried about your eye suffering damage from having such a large screen in your room, do not be alarmed. The laser distributes the light in such a way that your eyesight will be granted eye protection. APLD is used on this projector. That stands for Advanced, Laser, Fluorescence, Display, Technology. The light let off from this laser can be compared to a laser studio.

Sound is not a problem because the Mi-Laser Projector provides a state-of-the-art speaker [system](#). It can brace 3 types of audio.

What Sets Mi-Laser Projector Apart from other Laser Projectors

The increased energy is more efficient than other models. This has caused it to gain much popularity. Also it can boast of having a longer life than other models. The startup time to it coming on is much faster, and the brightness is much more intense and brilliant.

It has built-in content that is also incomparable to other models. The [remote control](#) is universal, and it is also a smart remote.

[Texas Instruments](#) is well-known for its products. They have partnered with over 35 countries around the world including China. They started out as a small oil and gas company, and now they help to power electronics. They are the unique digital power behind Mi-Laser Projector.

[Xiaomi](#) connected with several companies just to build this product.

But, what is most appealing to customers of this product is its cheap, affordable prices. Many people can't afford to spend thousands on an entertainment center at home. Samsung sells similar models for \$2,000 to almost \$3,000. Mi-Laser Projector is attractive to the hard worker who isn't rich and just wants to Netflix and chill. At a low price of \$1,470, if you can buy a fancy camera or desktop computer, you can buy this Projector.

You have just had a long, horrible day at work, and you just want to take your boots off and relax on the couch. Do you dread the crying babies at movie theaters? Stepping on stale popcorn can be a drag. Want to hang out with the girls but don't want to leave your house? A football game becomes 10x more entertaining when you are watching it on a wide screen. It can also be upsetting to see teenagers sneaking from one theater room to the next. And the cost of food at movie theaters is astonishing. Five dollars for a bag of popcorn?

No way, Jose.

The new Mi-Laser Project can create a beautiful view in the comfort of your living room.
